

PROJECT DESIGN

Standard Laptop Procurement Automation using ServiceNow Flow Designer

Project Document – 03

1. Design Overview

The project is designed to automate the transition from an approved Standard Laptop Service Catalog request to a hardware configuration task. The design uses ServiceNow Service Catalog and Flow Designer to connect the requester, approval process, Requested Item, Catalog Task, and Hardware assignment group.

2. System Architecture

The solution follows a ServiceNow-based workflow architecture. The Service Catalog acts as the request entry point, while Flow Designer provides the automation layer. The Requested Item acts as the business record that connects the original request to the automatically generated Catalog Task.

Component	Design Responsibility
User / Requester	Submits a Standard Laptop request.
Service Catalog	Provides the Standard Laptop catalog item and creates the request.
Approval Process	Routes the request for approval before configuration begins.
Requested Item	Stores the requested service information and provides the record used by the flow.
Flow Designer	Executes the automation after the relevant trigger/condition is satisfied.
Create Catalog Task	Creates the configuration task for the Requested Item.
Hardware Assignment Group	Receives the task and performs the laptop configuration.

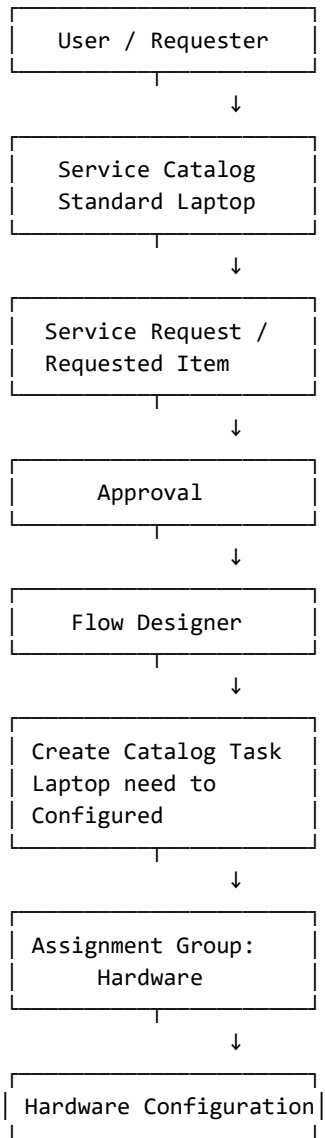

3. Workflow Design

The following logical workflow represents the proposed automation:

1. User opens the Service Catalog.
2. User selects the Standard Laptop catalog item.
3. User submits the laptop request using Order Now.
4. ServiceNow creates the Service Request and Requested Item.
5. The request enters the required approval process.
6. The approver reviews and approves the request.
7. The Flow Designer automation processes the approved request.
8. The Create Catalog Task action creates a task for the Requested Item.

- 9. The task receives the short description and description “Laptop need to Configured”.
- 10. The Assignment Group is set to Hardware.
- 11. The Hardware team receives the task and performs laptop configuration.
- 12. The task can be verified from the Catalog Tasks section of the Requested Item.

4. Architecture / Flow Diagram Representation

5. Flow Designer Design

Flow Property	Configured Value
Flow Name	Standard laptop task
Application	Global
Run As	System User
Trigger	Service Catalog
Action	Create Catalog Task
Request Item	Requested Item Record

Short Description	Laptop need to Configured
Description	Laptop need to Configured
Assignment Group	Hardware
Approval	Approved

6. Service Catalog Integration Design

The Standard Laptop catalog item is linked to the automation through the Service Catalog process configuration. The existing process engine configuration for the catalog item is updated so that the newly created Flow Designer flow is used for the automated process.

13. Open Maintain Items.
14. Locate the Standard Laptop catalog item.
15. Open the Process Engine configuration.
16. Remove the old/unused automation entries where required.
17. Add the Standard Laptop Task Flow.
18. Save the catalog item configuration.

7. ACL / Security Workflow

The project primarily uses the existing ServiceNow access controls and user roles rather than introducing a new custom ACL. Access should follow the principle that users only perform actions required for their responsibilities.

Role	Access / Responsibility
Requester	Can access the Service Catalog and submit the Standard Laptop request.
Approver	Can review and approve the relevant request according to the configured approval process.
IT Procurement	Can monitor the request and related Requested Item / Catalog Task records as permitted.
Hardware Team	Can access and process Catalog Tasks assigned to the Hardware group.
ServiceNow Administrator	Can configure and maintain Flow Designer, Service Catalog, and related system settings.

Where organization-specific ACLs are required, they should be configured by the ServiceNow administrator based on the organization's security policy. The automation itself should run with the configured system execution context so that the flow can create the required task.

8. Record Relationship

- Service Request (REQ) represents the overall user request.
- Requested Item (RITM) represents the Standard Laptop item requested by the user.
- Catalog Task (SCTASK) represents the operational task created for laptop configuration.
- The Catalog Task is associated with the relevant Requested Item.
- The Requested Item provides traceability from the user request to the hardware configuration activity.

9. Design Validation Points

- The Standard Laptop catalog item must be available before testing the flow.
- The Hardware assignment group must exist and be selectable.
- The Flow must be activated after configuration.
- The Standard Laptop item must reference the correct Flow Designer automation.
- An approved request should result in one corresponding configuration Catalog Task according to the designed process.
- The generated task should display the expected description and Hardware assignment.

10. Project Design Summary

The project design provides a clear connection between the Service Catalog request, approval process, Flow Designer automation, and Hardware configuration task. The design reduces manual handoffs while maintaining traceability between the Requested Item and Catalog Task. Existing ServiceNow access controls are used to ensure that each user group performs only the activities appropriate to its role.
