

PROJECT DEVELOPMENT

Standard Laptop Procurement Automation using ServiceNow Flow Designer

Project Document – 05

1. Development Overview

The development phase implements the planned Standard Laptop procurement automation in ServiceNow. The main development activity is the creation of a Flow Designer flow that creates a Catalog Task after the relevant Service Catalog request is approved. The task is configured with standard information and assigned to the Hardware group.

2. Development Environment

Component	Configuration
Platform	ServiceNow
Automation Tool	Flow Designer
Service Catalog	Standard Laptop catalog item
Flow Application	Global
Flow Execution User	System User
Task Type	Catalog Task
Assignment Group	Hardware

3. Milestone 1 – Flow Development

The first development milestone is to create the automation flow named “Standard laptop task”. The flow is created in Flow Designer and configured to create a Catalog Task for the Requested Item.

3.1 Create the Flow

1. Open ServiceNow.
2. Select All and search for Flow Designer.
3. Open Flow Designer under Process Automation.
4. Select New and choose Flow.
5. Enter the Flow Name as “Standard laptop task”.
6. Set Application to Global.
7. Select System User under the Run As option.
8. Submit/create the flow.

3.2 Configure the Trigger

9. Select Add a Trigger.
10. Search for Service Catalog in the trigger selection.
11. Select the Service Catalog trigger.
12. Configure the required trigger information.

13. Click Done to save the trigger configuration.

3.3 Configure Create Catalog Task Action

14. Under Actions, select Add an Action.
15. Search for Create Catalog Task.
16. Select the Create Catalog Task action.
17. Drag and drop the Requested Item Record into the Request Item field.
18. Verify that the table is populated as Catalog Task.
19. Set Short Description to “Laptop need to Configured”.
20. Use Add Field Value to configure the Description field.
21. Set Description to “Laptop need to Configured”.
22. Set Assignment Group to Hardware.
23. Set Approval to Approved.
24. Leave other fields at their default values unless required.
25. Click Done.

3.4 Save and Activate the Flow

26. Save the completed flow.
27. Select Activate.
28. Confirm activation when prompted.
29. Verify that the flow is active and available for use.

4. Flow Configuration Details

Field	Configured Value
Flow Name	Standard laptop task
Application	Global
Run As	System User
Trigger	Service Catalog
Action	Create Catalog Task
Request Item	Requested Item Record
Table	Catalog Task
Short Description	Laptop need to Configured
Description	Laptop need to Configured
Assignment Group	Hardware
Approval	Approved

5. Milestone 2 – Flow Assignment

The second development milestone connects the created Flow Designer flow to the Standard Laptop service catalog item.

30. Open ServiceNow.
31. Select All and search for Maintain Items.
32. Open Maintain Items.
33. Search for the Standard Laptop item using the Name field.
34. Open the Standard Laptop catalog item.

35. Open the Process Engine section.
36. Review the existing automation entries.
37. Remove the remaining/unused automation entries where required by the project configuration.
38. Add the Flow option.
39. Select the flow named “Standard laptop task”.
40. Save the catalog item configuration.

6. Milestone 3 – Development Verification

After the flow has been created and assigned to the Standard Laptop catalog item, the development is verified by executing the Service Catalog request process.

41. Open Service Catalog.
42. Navigate to Hardware.
43. Locate and open Standard Laptop.
44. Select Order Now.
45. Verify that the order is created.
46. Open the generated Request Number.
47. Open the Requested Item record.
48. Review the approval information.
49. Approve the request through the configured approval process.
50. Return to the Requested Item record.
51. Scroll to the Catalog Tasks section.
52. Open the generated Catalog Task.
53. Verify the short description, description, approval value, and Hardware assignment group.

7. Development Data Flow

- Service Catalog creates the request.
- The Requested Item stores the Standard Laptop request.
- Approval status is updated through the approval process.
- Flow Designer processes the request according to the configured flow.
- Create Catalog Task action creates the operational task.
- The Catalog Task is linked to the Requested Item.
- Hardware assignment group receives the task for configuration.

8. Users and Roles Used in Development

User / Role	Development Responsibility
ServiceNow Administrator / Developer	Create and configure the Flow Designer flow and catalog item process.
Requester	Submit the Standard Laptop service request.
Approver	Approve the submitted request.
Hardware Team	Receive and process the automatically generated Catalog Task.
IT Procurement Team	Monitor the request and verify task generation.

9. Access Control / ACL Considerations

The implementation relies on ServiceNow's configured access controls and user roles for the relevant records and activities. No new custom ACL script is required for the core automation described in this project. The Flow is configured to run as System User so that the automated Catalog Task creation can be performed by the workflow execution context.

- Only authorized users should access Flow Designer configuration.
- Requesters should have access to the Standard Laptop catalog item.
- Approvers should have permission to perform the required approval action.
- Hardware users should have access to Catalog Tasks assigned to their group.
- Administrative configuration should be restricted to authorized ServiceNow administrators.

10. Development Screenshot Evidence

The following screenshots should be captured from the ServiceNow instance and placed in the Project Development folder to provide implementation evidence:

- Flow Designer – Standard laptop task flow properties.
- Flow Designer – Service Catalog trigger.
- Flow Designer – Create Catalog Task action.
- Create Catalog Task – Requested Item mapping.
- Create Catalog Task – Short Description and Description.
- Create Catalog Task – Assignment Group set to Hardware.
- Create Catalog Task – Approval set to Approved.
- Activated flow status.
- Maintain Items – Standard Laptop Process Engine configuration.
- Standard Laptop catalog item with the created flow assigned.

11. Development Output

- Activated Flow Designer automation named Standard laptop task.
- Standard Laptop catalog item connected to the automation flow.
- Configured Create Catalog Task action.
- Automatically generated configuration task.
- Hardware assignment on the generated task.
- Traceable relationship between Requested Item and Catalog Task.

12. Project Development Summary

The development phase implements the proposed automation using ServiceNow Flow Designer. The Standard laptop task flow uses a Service Catalog trigger and Create Catalog Task action to generate a configuration task for the Requested Item. The task is standardized with the required description and assigned to the Hardware group. The flow is then associated with the Standard Laptop catalog item and verified through an actual service request and approval process. This completes the core technical implementation of the project.
