

PROJECT TESTING

Standard Laptop Procurement Automation using ServiceNow Flow Designer

Project Document – 06

1. Testing Overview

Testing is performed to verify that the Standard Laptop procurement automation works as designed. The main objective is to confirm that a Standard Laptop request can be submitted, approved, processed by Flow Designer, and converted into a Catalog Task assigned to the Hardware group with the required task information.

2. Testing Objectives

- Verify that the Standard Laptop catalog item is available to the requester.
- Verify that a Standard Laptop request can be submitted successfully.
- Verify that the approval process works correctly.
- Verify that the Flow Designer automation is triggered after the required condition is met.
- Verify that the Create Catalog Task action creates the expected task.
- Verify that the task is associated with the correct Requested Item.
- Verify the task short description and description.
- Verify that the Assignment Group is set to Hardware.
- Verify that the generated task can be viewed from the Requested Item.
- Verify that authorized users can access the required records according to their roles.

3. Test Environment

Test Item	Details
Platform	ServiceNow
Application	Service Catalog / Flow Designer
Catalog Item	Standard Laptop
Flow	Standard laptop task
Action	Create Catalog Task
Assignment Group	Hardware
Approval State	Approved
Test Type	Functional, Workflow and Access Verification

4. Test Cases

Test ID	Test Case	Test Steps / Input	Expected Result	Actual Result	Status
TC-01	Verify Standard Laptop catalog item	Standard Laptop is available under Service Catalog > Hardware.	Standard Laptop is displayed and selectable.	To be recorded during execution	Pass/Fail

TC-02	Submit Standard Laptop request	Select Standard Laptop and click Order Now with required information.	Service Request and Requested Item are created.	To be recorded during execution	Pass/Fail
TC-03	Verify Request Number	Open the submitted order.	A valid Request Number is displayed.	To be recorded during execution	Pass/Fail
TC-04	Verify Requested Item	Open the Requested Item from the request.	Correct Standard Laptop Requested Item is displayed.	To be recorded during execution	Pass/Fail
TC-05	Verify approval section	Open the approval information for the request.	Approval record is available for the request.	To be recorded during execution	Pass/Fail
TC-06	Approve Standard Laptop request	Approve the request using the configured approval process.	Request approval is updated successfully.	To be recorded during execution	Pass/Fail
TC-07	Verify flow execution	After approval, allow the configured flow to process the request.	Flow processes the approved request and creates the Catalog Task.	To be recorded during execution	Pass/Fail
TC-08	Verify Catalog Task creation	Open the Catalog Tasks section of the Requested Item.	A Catalog Task is displayed.	To be recorded during execution	Pass/Fail
TC-09	Verify short description	Open the generated Catalog Task.	Short Description is "Laptop need to Configured".	To be recorded during execution	Pass/Fail
TC-10	Verify task description	Check the Description field.	Description is "Laptop need to Configured".	To be recorded during execution	Pass/Fail
TC-11	Verify assignment group	Check Assignment Group on the Catalog Task.	Assignment Group is Hardware.	To be recorded during execution	Pass/Fail
TC-12	Verify approval value	Check the Approval field on the generated task.	Approval is Approved as configured.	To be recorded during execution	Pass/Fail
TC-13	Verify record relationship	Open the task from the Requested Item.	The Catalog Task belongs to the correct Requested Item.	To be recorded during execution	Pass/Fail
TC-14	Verify Hardware access	Login/access as an authorized Hardware team user and open the assigned	Authorized Hardware user can access the assigned task.	To be recorded during execution	Pass/Fail

		task.			
TC-15	Verify unauthorized configuration access	Use a user without administrative configuration permissions to access Flow Designer configuration.	User should not be able to modify administrative flow configuration.	To be recorded during execution	Pass/Fail

5. EEE User / Admin Verification

Where the project evaluation requires EEE User/Admin evidence, the following verification can be performed using the authorized ServiceNow test accounts supplied for the environment. The exact account names should be recorded from the actual instance rather than invented in the project report.

Test Role	Verification	Expected Result	Evidence
EEE User / Requester	Open Service Catalog and access Standard Laptop.	User can access and submit the catalog request according to assigned permissions.	Screenshot of catalog item / request
EEE User / Requester	Open submitted request and Requested Item.	User can view the request information permitted by the role.	Screenshot of request
Admin	Open Flow Designer and Standard laptop task flow.	Authorized administrator can view/configure the flow.	Screenshot of flow
Admin	Open Maintain Items > Standard Laptop > Process Engine.	Authorized administrator can verify the assigned flow.	Screenshot of catalog configuration
Hardware User	Open assigned Catalog Task.	Authorized Hardware user can access the task assigned to Hardware.	Screenshot of task

6. End-to-End Test Procedure

1. Open ServiceNow using an authorized test user.
2. Navigate to Service Catalog > Hardware.
3. Open Standard Laptop.
4. Click Order Now and submit the request.
5. Open the generated Request Number.
6. Open the Requested Item record.
7. Review the Approvers section.
8. Approve the request using the configured approval process.
9. Open the Requested Item again.
10. Scroll to Catalog Tasks.
11. Open the generated Catalog Task.
12. Verify Short Description, Description, Approval, and Assignment Group.
13. Verify that Assignment Group is Hardware.
14. Record screenshots as testing evidence.

7. Expected Final State

- Standard Laptop request exists.
- Request has completed the required approval.
- Flow Designer automation has processed the approved request.
- Catalog Task has been created.
- Catalog Task is linked to the correct Requested Item.
- Short Description is “Laptop need to Configured”.
- Description is “Laptop need to Configured”.
- Assignment Group is Hardware.
- Authorized Hardware user can access the task.

8. Testing Screenshot Evidence

- Standard Laptop catalog item before ordering.
- Order Now / request submission screen.
- Generated Request Number.
- Requested Item record.
- Approver section before approval.
- Approved request / approval confirmation.
- Requested Item Catalog Tasks section.
- Generated Catalog Task.
- Catalog Task Short Description and Description.
- Catalog Task Assignment Group showing Hardware.
- EEE User verification screenshot.
- Admin verification screenshot.
- Hardware user task access screenshot.

9. Defect Handling

If a test case fails, the failure should be documented with the Test ID, observed result, screenshot, probable cause, corrective action, and retest result. Typical issues may include an inactive flow, incorrect Requested Item mapping, incorrect catalog item assignment, missing Hardware assignment group, or insufficient user permissions.

Test ID	Observed Issue	Possible Cause	Corrective Action	Retest Result
To be filled during testing	To be filled during testing	To be filled during testing	To be filled during testing	To be filled during testing
To be filled during testing	To be filled during testing	To be filled during testing	To be filled during testing	To be filled during testing
To be filled during testing	To be filled during testing	To be filled during testing	To be filled during testing	To be filled during testing
To be filled during testing	To be filled during testing	To be filled during testing	To be filled during testing	To be filled during testing

10. Testing Summary

The testing process validates the complete Standard Laptop automation workflow from Service Catalog request submission through approval and automatic Catalog Task creation. The key verification points are successful flow

execution, correct task creation, correct task information, Hardware assignment, record traceability, and appropriate user access. The final Pass/Fail status and actual results should be completed using evidence collected from the ServiceNow test instance.
