

REQUIREMENT ANALYSIS

Standard Laptop Procurement Automation using ServiceNow Flow Designer

Project Document – 02

1. Requirement Analysis Overview

Requirement analysis identifies the functions, users, roles, and quality expectations required to implement the Standard Laptop Procurement Automation project in ServiceNow. The system is designed to automate the creation and assignment of a configuration task when a Standard Laptop service request is approved.

2. Users and Stakeholders

Requester / End User: Places a Standard Laptop request through the Service Catalog and tracks the request status.

Approver: Reviews the laptop request and approves or rejects it according to the organization's process.

IT Procurement Team: Monitors laptop requests and ensures that approved requests move into the configuration process.

Hardware Team: Receives the automatically generated Catalog Task and performs the required laptop configuration.

ServiceNow Administrator: Creates, configures, tests, and maintains the Flow Designer automation and related Service Catalog configuration.

3. Functional Requirements

- The system shall provide a Standard Laptop item through the Service Catalog.
- The requester shall be able to place a Standard Laptop order using the Order Now option.
- The system shall create a Service Request and Requested Item for the submitted catalog request.
- The request shall support the required approval process before the configuration task is created.
- The Flow Designer flow shall be associated with the Standard Laptop service catalog process.
- After the request is approved, the flow shall create a Catalog Task for the Requested Item.
- The Catalog Task shall contain the short description "Laptop need to Configured".
- The task description shall contain the same configuration requirement so that the Hardware team receives clear instructions.
- The Assignment Group of the generated task shall be set to Hardware.
- The approval value of the task shall be set to Approved as required by the workflow.
- The system shall allow the generated Catalog Task to be viewed from the Requested Item record.
- The Hardware team shall be able to access and process the assigned configuration task.
- The system shall maintain the request and task records for tracking and verification.

4. Non-Functional Requirements

Reliability: The flow should consistently create the required Catalog Task after an approved Standard Laptop request.

Usability: The workflow should be simple for requesters, approvers, procurement staff, and the Hardware team to understand and use.

Performance: The automated task creation should occur without unnecessary manual delay after the triggering condition is satisfied.

Maintainability: The Flow Designer configuration should be easy for a ServiceNow administrator to review and modify.

Security: Only authorized ServiceNow users should be able to submit, approve, configure, or manage the relevant records according to their roles.

Traceability: The relationship between the Service Request, Requested Item, and Catalog Task should remain visible for monitoring and verification.

Consistency: The generated task should use standardized descriptions and assignment information.

Scalability: The design should support the processing of additional Standard Laptop requests without requiring manual creation of individual configuration tasks.

5. Roles and Responsibilities

Requester – Submit the Standard Laptop request and provide the required information.

Approver – Review the request and provide approval before the configuration activity begins.

IT Procurement – Monitor approved requests and ensure that procurement activities progress correctly.

Hardware – Receive the generated Catalog Task and configure the laptop.

ServiceNow Administrator – Configure the Flow Designer flow, catalog item association, and related system settings.

6. System Requirements

- ServiceNow instance with access to Service Catalog and Flow Designer.
- Standard Laptop service catalog item must be available.
- Flow Designer must be available to create and activate the automation.
- A Hardware assignment group must be available for task assignment.
- Users involved in requesting, approving, procurement, and hardware configuration must have appropriate ServiceNow access.
- The ServiceNow instance should support Catalog Task creation and Requested Item records.

7. Input Requirements

- Standard Laptop catalog item selection.
- Required catalog request information entered by the requester.
- Service Request and Requested Item record generated by ServiceNow.
- Approval decision for the request.
- Requested Item record used by the Flow Designer action.

8. Output Requirements

- A Catalog Task generated automatically after approval.
- Short description: "Laptop need to Configured".
- Description: "Laptop need to Configured".
- Assignment Group: Hardware.
- Approval status: Approved.
- Catalog Task visible under the Requested Item record.

9. Business Rules / Process Conditions

- The Standard Laptop request must pass through the required approval process.
- The automated task creation should occur only when the relevant approval condition is satisfied.
- The generated task must be associated with the correct Requested Item.
- The configuration task must be assigned to the Hardware group.
- The workflow should not require an employee to manually create the standard configuration task.

10. Basic Use Case

1. Requester opens the Service Catalog.
2. Requester selects Standard Laptop.
3. Requester submits the order.
4. ServiceNow creates the Service Request and Requested Item.
5. Approver reviews the request.
6. Approver approves the request.
7. Flow Designer processes the approved request.
8. A Catalog Task is automatically created.
9. The task is assigned to the Hardware group.
10. Hardware team opens the task and performs laptop configuration.
11. The task and request can be verified through the Requested Item record.

11. Requirement Acceptance Criteria

- A Standard Laptop request can be successfully submitted.
- The request can be approved through the ServiceNow approval process.
- After approval, a Catalog Task is automatically created.
- The Catalog Task contains the required short description and description.

- The Assignment Group is displayed as Hardware.
- The generated task is visible under the correct Requested Item.
- The complete process can be verified without manually creating the configuration task.

12. Requirement Analysis Summary

The requirements establish a clear automation process for Standard Laptop procurement. The primary functional requirement is the automatic creation and assignment of a Catalog Task after approval. The non-functional requirements focus on reliability, usability, performance, security, maintainability, consistency, traceability, and scalability. These requirements provide the foundation for designing, developing, and testing the ServiceNow Flow Designer solution.
